

CARE OF PURPLE SPOTTED GUDGEON

- **Water**

- Fill aquarium using the bucket provided with tap water, remember to keep count of how many buckets you use
- For every bucket of water, add one drop of the water conditioner provided
- Place the bubbler next to the tank and place the stone in the corner. Keep this in place using the lid
- Let the bag with fish inside sit in the water for approximately 30min-1hour. This allows the temperature of the bag water to match the temperature of the tank, decreasing the shock to the fish

- **Food**

- Feed the fish 1 square of blood worm every other day
- Feed 2 squares on Saturday to get through weekend

- **Cleaning**

- For large amounts of debris in the water, use the net to scoop it all out
- Ensure fish are returned in the bag and inside the bucket (this is their seatbelt for the car ride).
- Ensure fish are checked at least once over the weekend
